

## HOME AND FARM.

It is not advisable to sow buckwheat or any other crop on the same ground three or four years in succession without specially good manuring.

To utilize the feathers of ducks, chickens and turkeys, generally thrown aside as refuse, trim the plume from the stump, inclose them in a tight bag, rub the whole as if washing clothes and you will secure a perfectly uniform and light down, excellent for quilting coverlets and not a few other purposes.—*N. Y. Herald.*

The statement in regard to the value of sawdust as a manure for potatoes is not worthy of notice. Sawdust has no fertilizing value until it is quite rotten, and then no more than that of the ashes that could be made from it. Hardwood sawdust is useful for litter in the stables and as an absorbent, but alone, as a fertilizer, it is entirely without value.—*N. Y. Times.*

—*Grain Bread.* Make a sponge the same as for wheat bread; when risen add one quart of tepid water, a teaspoonful of salt, one cup of bran meal, two teaspoonfuls of brown sugar, then knead the Graham flour enough to make a stiff dough; let it rise over night; mold it in loaves in the morning and bake when light. Graham loaves require longer baking than white bread.—*N. Y. Herald.*

There are now in the United States six Agricultural Experiment Stations—one in each of the States of Connecticut, North Carolina, New Jersey, New York, Massachusetts and Ohio. Much information of value to farmers has already been obtained by careful experiments at these institutions, and a wide field for future usefulness is open before them.—*if crocheting and riders of hobbies are rigidly excluded from the management of them.*—*N. Y. Examiner.*

—*Fruit Pudding.* Three pints of milk, eight Boston crackers split and buttered, six eggs beaten light, two cups of sugar, one teaspoonful of salt, quarter of a nutmeg grated, half a teaspoonful of cinnamon, one pound of stoned raisins, quarter of a pound of currants. Boil the milk, and then add sugar, eggs and flavoring. Butter a deep pudding dish, put in a layer of crackers and moisten with a little of the custard. Then add a layer of fruit, and so till all is in the dish. Pour over the rest of the custard and bake in a slow oven. Brown at the last, and eat hot with or without sauce.—*New England Farmer.*

## Western Stock Business.

To precisely what extent the stock business on the plains is carried on by companies, we do not know. There are a number of companies of larger or smaller pretensions, and we suppose that their success has suggested what we regard as purely wild-cat schemes. In former issues we have taken occasion to utter a word of warning to the public in regard to the organization of these live stock companies. The live stock business is not so certainly successful anywhere that anybody, with brains or without, or with or without experience, can turn it to success. That companies can be formed, successfully run, and made to pay even a large dividend upon the capital invested is all true enough. But we do not believe that we can give any better advice to the readers of *The Western Rural* than to advise them to keep their money out of all such enterprises. If they follow that advice, they will escape two dangers, both of which are probable: Loss through unavoidable circumstances, and loss through schemes who know nothing at all about stock raising or who never intend to invest the money they may receive for stock, in the business. We see live stock companies advertising their stock for sale, about whose officers we can learn nothing, and who appear to be adventurers; and in order to be on the safe side, in any event, we should not invest in the stock. And then again, we are suspicious that some of these companies, while not fraudulently conceived, are organized by those who are wholly ignorant of the business, and can not therefore possibly conduct it successfully. There is a class of men in all cities, who think they are competent to manage live stock enterprises; indeed they do not think that live stock business needs any management, but that all in the world that is needed is to buy a herd of cattle, or a flock of sheep, and sit down to wait for the profits. In the office of a newspaper like this, we frequently meet such men, who are of all ages and conditions of life. The lawyer, doctor, clerk and merchant turn up periodically with the question, Where had I better go to engage in the live stock business? To follow the lead of the plains have been subjected by the plow, because the food weeds which abound on them would vitiate the flavor of milk, and injure its products. Particular products may do best in special localities, but the extent of country in which the various farm products can be produced is so large, that no one can long hold a monopolizing position. This gives security to all our agricultural industries, and allows each farmer with safety to gravitate towards the business for which his farm is best adapted. For these reasons, we say to all who have farms better adapted to dairying than to other modes of farming, that there is no occupation which is more likely to prove remunerative and lasting, no matter how many may engage in it, or whether there is or is not a foreign outlet for dairy products, and it may be added, without any fear of ruin by competing imitations. It is sheer folly to sigh for an export trade in dairy products, when we are secured in a better market at home. Cheese is now somewhat dependent on the English markets for a small surplus, because so much of the make of that article is made in shape and quality to suit that market, and is thereby not so well suited to home use. If the preferences of the American taste were better studied, it would not be long before there would be no cheese to send abroad, and the domestic trade would call for a larger amount than is now made, and at better prices. This inference is supported by the fact now patent among dealers, that the best and highest-priced cheese is consumed in this country, and that the rate of consumption is steadily increasing, thereby encouraging the hope that all our fine cheese, like our fine butter, will soon find a better market at home than abroad, leaving for export only such goods as our own people reject.—*National Live Stock Journal.*

## Exportation of Dairy Products Questionable.

The lamentations which are occasionally heard in regard to the small amount of butter exported, evidently come from parties who fail to comprehend the true bearing of the situation.

The simple reason why we export so little butter is because the market at home is better than the markets abroad. The price of butter in Boston, New York and Philadelphia, and also in this city, is habitually higher for choice grades than in London, Liverpool, Glasgow, or the large cities of continental Europe. Our own cities and large villages furnish for our dairy farmers the best butter market in the world. For low grades of butter the situation is different. The distinction in price between different grades is generally considerably less in Great Britain and Continental Europe than it is here. If we are unfortunate enough to have butter which is not first-class, we can often do better with it abroad than at home. Our people are the greatest butter eaters in the world, consuming fifteen pounds per capita annually.

We have a much larger class of well-to-do citizens who are able to gratify their preferences in regard to the butter they eat than exists in the monarchical countries of Europe, and they do not hesitate to pay high prices for what pleases them, and to reject whatever does not suit so well. Hence, grades of butter which fall below first-class occasionally accumulate and find a better market with the laboring classes abroad than they do at home; and this kind of butter is what constitutes the bulk of our small exports of that article. The English market is open for foreign butter, and would take a large share of what we make if we should choose to send it there. The only reason why we do not send more than we do is because our consumers bid higher for it than the consumers in England and other countries. It is not, as is sometimes insinuated, because our butter is inferior and is not wanted abroad, nor because we can not make it cheap enough to enable us to compete in the English markets and live as well as those who now furnish those markets with fine butter. The superior grades of butter made in the United States are unsurpassed in quality by any of the European nations, and the vast extent of cheap and well-watered lands in their northern half enable producers to turn it out at a cost below what it is possible to do on the costly lands of Europe.

The American producer of the first-class butter is a happy and prosperous man compared with his European rival, for he can produce his goods at less cost and sell for a higher price. Nor is his situation a spasmodic one, which is likely to suffer great or sudden changes. The long time which he has enjoyed this position affords a strong presumption of its continuance, for he has enjoyed it almost uninterruptedly for the last quarter of a century, but he has a stronger reason for security in his position from the equally prosperous condition of other agricultural industries. The American farmer has a versatility of talent, and is far from being fixed or rigid in his habits. If he could do better by one line of farming than another, he can oscillate from one to another, with ease, and without annoyance or friction. If the production of butter, or wool, or meat, or grain, or any kind of stock would yield better returns than other branches of farming, he would be sure to lean to the most profitable one, till an excess of production would bring it to a level with the rest. The fact that the production of butter, which is known to be highly profitable when properly carried on, does not attract votaries enough to crowd prices lower, is an evidence that other lines of farming in this country pay quite as well as butter production, and in this fact, butter producers have the strongest guarantee that the present status of their industry will neither change widely nor suddenly. If the present producers of meat, for example, could make more by producing butter, they would not hesitate to change from meat to butter; but the fact that a larger number do not make the change is proof that they are doing as well in the business they are occupied with. Some situations are better suited to producing meat, others to producing grain, and others for butter, etc.

The unappropriated plains of the West and Northwest are better suited to producing beef than butter. When they come to be divided into small farms, tillage will pay better than beef, and when they have become worn by much plowing, dairying brings the best returns, but dairying would be out of place before the wilds have been subdued by the plow, because the food weeds which abound on them would vitiate the flavor of milk, and injure its products. Particular products may do best in special localities, but the extent of country in which the various farm products can be produced is so large, that no one can long hold a monopolizing position. This gives security to all our agricultural industries, and allows each farmer with safety to gravitate towards the business for which his farm is best adapted. For these reasons, we say to all who have farms better adapted to dairying than to other modes of farming, that there is no occupation which is more likely to prove remunerative and lasting, no matter how many may engage in it, or whether there is or is not a foreign outlet for dairy products, and it may be added, without any fear of ruin by competing imitations. It is sheer folly to sigh for an export trade in dairy products, when we are secured in a better market at home. Cheese is now somewhat dependent on the English markets for a small surplus, because so much of the make of that article is made in shape and quality to suit that market, and is thereby not so well suited to home use. If the preferences of the American taste were better studied, it would not be long before there would be no cheese to send abroad, and the domestic trade would call for a larger amount than is now made, and at better prices. This inference is supported by the fact now patent among dealers, that the best and highest-priced cheese is consumed in this country, and that the rate of consumption is steadily increasing, thereby encouraging the hope that all our fine cheese, like our fine butter, will soon find a better market at home than abroad, leaving for export only such goods as our own people reject.—*National Live Stock Journal.*

If your horses have sore shoulders, scratches, cuts or open sores of any kind, use Stewart's Healing Powder.

## Irresistibly Ludicrous.

One of those things happened at the National Theater the other night which most papers are too dignified to mention, but which everybody likes to talk about. It was during the last act of "Mother and Son," and Janauschek, with one other person, was holding the stage. It was a situation of some suspense, and the house was perfectly still. There was a pause, too, in the dialogue, so that on the stage, also, there happened to be complete stillness. Just at that moment a man in the parquette blew his nose. It was not a violent, savage blast, but a long, sonorous, luxurious blow, such as the horns that marched around Jerico might have given on the seventh round, in the serene confidence that the walls would come down promptly. The effect was irresistibly ludicrous. The audience, in their respect for the actors and their interest in the play, struggled bravely to preserve a good composure, but it was no use. A wave of half-suppressed laughter ran over the house, and many who succeeded in keeping silence fairly shook.

On the stage the situation was still worse. Even Janauschek's tragic gravity was disturbed. He face twitched again and again in the effort to control himself, and she was glad to use the handkerchief she had in her hand to cover her confusion. For a moment it looked as if an emotional scene would be dissolved in a broad laugh, but the actors struggled with the dialogue, and after a few minutes the play resumed its hold on the audience. For the man, or rather the nose, was a successful debut.—*Washington Cor. N. Y. Tribune.*

Dynamite is about to be thrown into the shade. An ingenious citizen of Paris, the appropriate home of such discoveries, has produced a new compound which he calls pandastite. Pandastite consists of hypozotic acid, which is one of the numerous compounds of oxygen and azote, or nitrogen, mixed either with essence of petroleum or sulphur of carbon. The degree of explosive force is said to depend upon which of the last named ingredients is used.—*Chicago Herald.*

A Toothsome Morsel.

This from the Madison (Wis.) Democrat, conveys its own moral: Hold on! We are cognizant of the fact that an aching tooth has been long cured by the application of St. Jacobs Oil. The young fellow got mad over his raging tooth in the ball room, and rushed straightway to a drug store where he applied the good old German Remedy; in ten minutes the toothache had gone.

A good illustration of the ruling passion strong in death is found in Ab Duke, a Celestial murderer, who was in a hurry to be changed because he believed that for twenty years after he had joined the "Jerkers," a polite phrase for hanging—he would be able to return to earth and torment his enemies. How delightful to look forward to the time when you can enjoy the privileges of a "spook," and at the witching hour of night rap on the bedpost of your mortal foe, and then stalk about the room a white and horrid apparition, while the aforementioned mortal foe's eyeballs are starting out of their sockets, and his brow is wet with the dew of terror! Beautiful ambition! And to be impatient to be banged in order that you can enjoy the privileges of a "spook" without delay! We confess that mania has no attraction for us, even with such employment beyond the grave.—*N. Y. Herald.*

A lady writes: "Overwork, care, anxiety, grief, sorrow, kindness, etc., made quite an invalid of me. I suffered great fatigue and was very nervous. Dr. Guy's Yellow Dock and Sarsaparilla has made me feel more able to endure hardships."

## THE LOST CHILD.

A FATE WORSE THAN ABDUCTION.

How Parents, by a Lack of Precaution and Care, are Responsible for the Death of Their Children.

(Caden, Me. Herald.)

The moral and legal responsibility of parents, in the care of their children is, fortunately, attracting the serious attention of the better portion of the entire country. The many instances of child beating, oppression, and other forms of cruelty which have come to light, demand that something be done; and it is gratifying to know that the people are becoming thoroughly aroused. Whether the cruelty be in the form of physical violence or physical neglect matters not—the principle in both cases is the same. The man or woman who neglects his or her own health may be pardoned, as the consequences fall upon the individual alone; but the parent or guardian who permits the inroads of disease upon the innocent ones dependent upon him for protection, is criminally liable in the sight of God, however he may appear in the eyes of men. There are, however, parents that intend to care for their children, but, who through carelessness or the urgency of other duties, permit them to become the innocent victims of disease. Such parents may be guilty of intentional wrong, but the disastrous results upon their children are just as great.

These are truths which must be instilled into every worthy parent and especially in a vicinity where the unknown effects of the atmosphere, the water and the general tendency to malaria are so great. There are many families in this locality who have been called upon to mourn untimely losses, even when the greatest care was exercised; but the experience of one only will be given: It is that of the late W. C. Thomas. The children were all most promising, but for some unexplained reason their health and strength seemed to gradually lessen until their friends feared that they were the victims of consumption. One by one, they sickened and died until three had departed and two of the surviving brothers were also taken ill. Their names were Harmon and Edward. Harmon, however, seemed the stronger of the two; and, while his younger brother was confined to the house constantly, and to his bed much of the time, Harmon was about as usual. He had no desire to play; Eddie's symptoms were terrible. He found difficulty in retaining food upon his stomach, and was restless and irritable, and out of his head frequently. At various times several different physicians visited him; and each one told his friends he could not live. He finally got so low that death was only considered a matter of a few days. At the critical time his elder brother, aroused almost to the pitch of desperation by the three deaths that had so recently occurred, resolved to take the case into their own hands. They accordingly did so, and secured a remedy that was then being universally used, and began giving it to him. His next attack was slight, but any improvement was considered a good symptom. By degrees his strength returned; he was able to eat with a relish, then walk about the house, and finally he regained complete health and strength. The boy was so rejoiced over his recovery that, accompanied by the editor of this paper, he went before Justice Charles K. Miller and made oath to the facts of his sickness as above related, and that he was restored to perfect health by the use of Warner's Safe Kidney and Liver Cure. Now, Edward's home parents, with the boy, undoubtedly, provided faithfully for the wants of all their children; and yet the seeds of disease had taken deep root. Their care in one direction had been counteracted by unknown carelessness in another. Their love was sincere, but wholly misdirected. They should have known that children are just as liable to kidney and liver diseases as grown-up people; and that the fatality of Bright's disease of the kidneys is just as great among little children as with adults. This is a serious subject. Hereditary taints, the action of excrement and menses, and scarlet fever, diphtheria and the passing troubles which so easily become chronic, all demand the greatest care and caution. No case of cholera, infantum, measles, scarlet fever, diphtheria was ever virulent while the child's kidneys and liver were healthy. It would simply be an impossibility. These important organs of the body are just forming within the child and growing with its growth; and they can be trained to strength and health as readily as the little mind can be trained to truth and uprightness.

Of carefully watching the slightest troubles of the child, and especially those affecting the kidneys and liver, can not be too strongly emphasized. Children are so sensitive to the proper remedies, and are so sensitive to disease that it is a sin to deprive them of one at the risk of incurring the other. By a judicious treatment these essential organs can be developed, and the child's constitution able to resist the inroads of disease through coming years, shall be the result.

The photographer's business is always at a standstill.

"Do Likewise."

Dr. R. V. Pierce, Buffalo, N. Y.—"Five years ago I was a dreadful sufferer from uterine trouble. Having exhausted the skill of three physicians, I was completely unable to obtain an improved state. I was compelled to cross the room alone. I began taking your 'Favorite Prescription' and using the local treatment recommended in your 'Common Sense Medical Adviser.' In three months I was perfectly cured. I wrote a letter to my family paper, briefly mentioning how my health had been restored, and offering to send the full particulars to any one willing to pay for them and enclosing a stamped envelope for reply. I have received over four hundred letters. In reply, I have described my case and the treatment, and have been extremely advised them to 'do likewise.' From a great many I have received second letters of thanks stating that they had commenced the treatment and were much better already."
